

Important Health & Safety Notice

Are you up to date with your Portable Appliance Testing?

Electricity kills and injures people.

Electricity has considerable potential to cause serious injury or even kill. Every year in the UK, about 30 people die from coming into contact with electricity and many more people receive serious injuries. About 25% of these accidents occur as a result of using portable appliances. By PAT Testing your electrical equipment, you should be able to spot faults before they have a chance to harm anyone.

We highly recommended PAT Testing where:

1. Appliances are used by employees.
2. The public may use your appliances
3. Appliances are supplied or hired.
4. Appliances are repaired or serviced.

What is a Portable Appliance Test (PAT Test)?

A Portable Appliance Test (PAT Test) ensures that all your electrical equipment is safe. The vast majority of faults on electrical appliances can be found just by looking at the appliance (cracked plug, damaged cable etc), however, our specialist PAT Testing equipment also carefully inspects and checks for internal faults that is not visible and could remain unnoticed and dangerous.

We provide a cost effective PAT Test risk assessment service that will ensure that all your portable electrical equipment is safe and that your business fully complies with the I.E.E. Code of Practice and the Electricity at Work (Jersey) Regulations 1983.

Key Benefits of Pat Testing are:

1. Faulty and dangerous equipment is quickly identified.
2. Prevention of accidents, injury and fire
3. Offers increased safety for employees and third parties.
4. Can offer improved insurance rating with reduced insurance premiums.
5. Decrease in liability and peace of mind.

Please call Pat Pass Jersey today for more information or to arrange a free no obligation quote.
